

Security Operations

In a typical large enterprise, security teams are inundated with multiple feeds of information and analytics. In parallel, attacks via various vulnerabilities continuously target critical business services, infrastructure and users.

To manage, Security and IT Operations must work closely together but many of these enterprises have a reliance on manual processes, cross-team hand-offs and separate silo systems – this impacts the security team’s efficiency and effectiveness.

Cyber is now an innate part of IT delivery, not a bolted-on afterthought. The intersections among ITSM/CMDB, delivery processes, and Cyber have never been more necessary. CSC is taking ServiceNow Consulting expertise (via acquisition of Fruition Partners) and market-leading Cyber Services to bring clients a new integrated operating model.

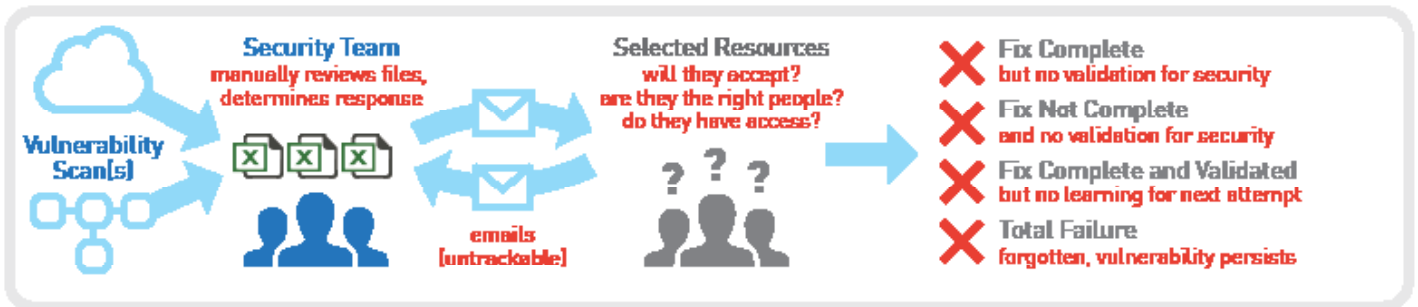

It provides a single platform for managing security incidents and vulnerabilities. It closes the “gap” between Security and IT Operations – enhancing and automating these mostly manual, inefficient processes. A natural fit for ServiceNow.

ADDRESSES & ENHANCES SECURITY OPERATIONS:

- ▶ Incident, vulnerability and remediation operation workflows
- ▶ Integration with security monitoring and threat systems
- ▶ Visualization and reporting from single operational source

The Current “Process”

Closing the Vulnerability Loop!
